# **VChannel**

Library version: RENAT 0.1.11
Library scope: test suite
Named arguments: supported

## Introduction

A basic library that provides Terminal connection to routers/hosts

VChannel is a core RENAT library that maintains input/output to nodes with an attached virtual terminal. It encapsulates the SSH/Telnet connections behind and provides common usage of access and execute commands to the nodes. Each channel instance has its own log file and a virtual terminal.

#### **Table of Contents**

- Device, Node and Channel
- Connections

- Keywords

# **Device, Node and Channel**

RENAT has 3 types of connection target. Device, Node and Channel.

#### Device

Each device stands for a real physical box that has its own IP address and is defined in the master file device.yaml . Users do not directly use device in keywords.

### Node

Node is a logical instance of a device. It could stand for a logical instance of a router or just a virtual terminal to the router. Nodes were defined in local.yaml of the test case. Several nodes could point to a same device.

#### Channel

Each channel holds a session to a node. Each channel has its own log file and a virtual terminal. Any command used by <u>Cmd, Write</u> or <u>Read</u> will be logged to the log file. Each channel is identified by a name when it is created with <u>Connect</u> keyword and is released with <u>Close</u> keyword.

**Notes:** multi sessions to a same device could be done with predefined multi nodes to same device in the local.yaml file or by using multi <u>Connect</u> with different <u>name</u>.

# **Connections**

The library provides a channel to a target node. Each channel is attached with a virtual terminal. Input and output to the node are made through this virtual terminal. This will help to provide the output looks like the output when operator is using the real terminal.

When keywords <u>Read</u>, <u>Write</u>, <u>Cmd</u> are used, if the connection is not available anymore, the system will try to reconnect to the host with the information provided in the 1st connect. It will try max\_retry\_for\_connect times and wait for interval\_between\_retry seconds between retries. The values of max\_retry\_for\_connect and interval\_between\_retry are defined in ./config/config.yaml

Usually when RENAT could not make the connections to the target, the system will raise an exception. But if the ignore\_dead\_node is defined as yes in the current active local.yaml, the system will ignore the dead node, remove it from the global variable LOCAL[node] and NODE and keep running the test.

### **Shortcuts**

Change Log · Change Prompt · Close · Close · Close · Close · Close · Close · Connect ·

## Keywords

Keyword	Arguments		Documentation
Change Log	log_file, mode=w	Stops current log file and cr	reate a new log file.
		Every log from that point wi	Il be saved to the new log file Return old log filename
Change Prompt	str_prompt	Changes the current prompt	t of the channel
		Returns previous prompt. U command that expects to s	ser should change the prompt before execute the new ee new prompt.
		Example:	
		Router. Switch	vmx11
		\${prompt}=	VChannel. <u>Change Prompt</u> %
		VChannel. <u>Cmd</u>	start shell
		VChannel. <u>Cmd</u>	Is

		Vchannel. <u>Cmd</u> exit		
Close		Closes current connection and returns the active channel name		
Close All		Closes all current sessions and flush out all log files.		
		January Control of the Control of th		
Cd	sammand prompt None	Current node name was reset to None		
Cmd	command=, prompt=None, timeout=None, match_err= (unknown	Executes a command and wait until for the prompt.		
	command. syntax error, expecting <command/> .)	This is a blocking keyword. Execution of the test case will be postponed until the pro appears. If prompt is a null string (default), its value is defined in the ./config/template.yaml		
		timeout is the timeout for this <u>Cmd</u> . If timeout is not define, the local vchannel/cmd-timeout or global vchannel/cmd-timeout will be used.		
		The keyword returns error when the output matches the match_err and the default co value <i>cmd-auto-check</i> is True		
		Output will be automatically logged to the channel current log file.		
		See Common for details about the config files.		
Cmd And Wait For	command, keyword, interval=30s, max_num=10,	Execute a command and expect keyword occurs in the output. If not wait for interval and repeat the process again		
	error_with_max_num=True	After max_num, if error_with_max_num is True then the keyword will fail. Ortherwise test continues.		
Cmd And Wait For Regex	command, pattern, interval=30s, max_num=10, error_with_max_num=True	Execute a command and expect pattern occurs in the output. If not wait for interval a repeat the process again		
		When the keyword contains not: at the beginning, the matching logic is revsersed.		
		After max_num, if error_with_max_num is True then the keyword will fail. Ortherwise test continues.		
Cmd More	<pre>cmd=, wait_prompt=.*\(more.*\), press_key= , prompt=None</pre>	Execute a command and press <i>press_key</i> when <i>wait_prompt</i> is displayed until the prompt		
Cmd Yesno	cmd, ans=yes, question=? [yes,no]	Executes a cmd, waits for question and answers that by ans		
Connect	node, name, log_file, timeout=20m, w=80, h=32, mode=w	Connects to the node and create a VChannel instance		
		Login information is automatically extracted from yaml configuration. By defaullt a virterminal (vty100) with size 80x64 is attachted to this channel.		
		If a login was successful, VChannel will create a log file name log_file for the connection the current result folder of the test case. This log file will contain any command input/output executed on this channel.		
		Multi sessions to the same node could be open with different names. Use <u>Switch</u> to change the current active session by its name		
		Examples:		
		Connect         vmx11         vmx11.log           Connect         vmx11         vmx11.log         80		
		See Common for more detail about the yaml config files.		
Connect All	prefix=	Connects to all nodes that are defined in active local.yaml.		
		A prefix prefix was appended to the alias name of the connection. A new log file by <alias>.log was automatiocally created.</alias>		
		See Common for more detail about active local.yaml		
Current Prompt		Return current prompt		
Exec File	file_name, vars=, comment=#, step=False, str_error=syntax,rror	Executes commands listed in file_name Lines started with comment character is considered as comments		
		file_name is a file located inside the config folder of the test case.		
		This command file could be written in Jinja2 format. Default usable variables are LOC and GLOBAL which are identical to Common.LOCAL and Common.GLOBAL. More		
		variables could be supplied to the template by vars.		
		vars has the format: var1=value1,var2=value2		
		If step is True, after very command the output is check agains an error list. And if a match is found, execution will be stopped. Error list is define by str_err, that contains multi regular expression separated by a comma. Default value of str_err is error		
		A sample for command list with Jinja2 template:		
		show interface {{ LOCAL['extra']['line1'] }} show interface {{ LOCAL['extra']['line2'] }}		
		{% for i in range(2) %}		

		{% endfor %}
		Examples:
		Router. <u>Exec File</u> cmd.lst  Router. <u>Exec File</u> step=\${TRUE} str_error=syntax,error
		<b>Note:</b> Comment in the middle of the line is not supported For example if comment is "#"
		# this is comment line < this line will be ignored ## this is not an comment line, and will be enterd to the router cli,
		but the router might ignore this
Flush All		Flushes all remain data into the logger
Get Channel	name	Returns a channel by its name
Get Channels		Returns all current vchannel instances
Get Current Channel		Returns the current active channel
Get Current Name		Returns the current active channel's name
Get Ip		Returns the IP address of current node Examples:
GO. 15		\${router_ip}= Router. Get IP
Log	msg	Writes the log message msg to current log file of the channel
Read	silence=False	Returns the current output of the virtual terminal and automatically logs to file.
110		In normal mode this will return the <b>unread</b> output only, not all the content of the screen.
Reconnect	name	Reconnects to the name node using existed information
Necomico	Hame	
		The only difference is that the mode of the log file is set to `a+` by default
Set Log Separator	sep=	Set a separator between the log of read, write or cmd keywords
Snap	name, *cmd_list	Remembers the result of a list of command defined by cmd_list
		Use this keyword with <u>Snap Diff</u> to get the difference between the command's result. The a new snapshot will overrride the previous result.
		Each snap is identified by its name
Snap Diff	name	Executes the comman that have been executed before by name snapshot and return the difference.
		Difference is in context diff format
Start Screen		Starts the screen mode.
Mode		In the screen mode, the output is just the same with the real terminal. It means that any real-time application likes top will be captured as-is. Consecutive <u>read</u> from this VChannel instance may produce redundancy ouput.
Stop Screen		Stops the screen mode and returns to normal mode
Mode		In screen mode, <u>Write</u> does not return any thing and no output is logged. In normal mode, escape sequences are not processed by the virtual terminal.
Switch	name	Switches the current active channel to name. There only one active channel at any time
		Returns the current channel_id, local_channel_id and the output of current terminal.
		<b>Notes:</b> There is no assurance that the output of previous <u>Write</u> command will be in the retur output because keywords like Logger. Log All will update every channels.
		Examples:
		VChannel. <u>Switch</u> vmx12
Write	str_cmd=, str_wait=0s,	Sends str_cmd to the target node and return after str_wait time.
	start_screen_mode=False	If start_screen_mode is True, the channel will be shifted to Screen Mode. Default value of screen_mode is False.
		In normal mode, a new line char will be added automatically to the str_cmd and the command return the output it could get at that time from the terminal and also logs that to the log file.
		In screen Mode, if it is necessary you need to add the new line char by your own and the ouput is not be logged or returned from the keyword.
		Parameters:
		<ul> <li>str_cmd: the command</li> <li>str_wait: time to wait after apply the command</li> <li>start_screen_mode: whether start the screen mode right after writes the command</li> </ul>
		Special input likes Ctrl-C etc. could be used with global variable \${CTRL- <char>}</char>

Returns the output after writing the command the the channel.

When str\_wait is not 0s, the keyword read and return the output after waiting str\_wait.

Otherwise, the keyword return without any output.

Notes: This is a non-blocking command.

Examples:

VChannel. Write monitor interface traffic start\_screen\_mode=\${TRUE}

VChannel. Write \${CTRL\_C} # simulates Ctrl-C

Altogether 29 keywords. Generated by <u>Libdoc</u> on 2018-12-02 19:41:49.
